Fluid paste

Example of use

The product Demelan® 1990 incorporates by simple stirring to the hypochlorite solutions. The recommended use doses go from 2 to 4% depending on the final desired viscosity.

If Demelan® 1990 is dosed by means of automatic hypochlorite diluters or similar dispositives it is recommended, to avoid the extended final stirring process that can produce a foam excess, to previously dilute the product 50% in water, and adjusting the dosing dispositive if necessary.

It is important and necessary to add to the hypochlorite solutions, before adding the Demelan® 1990 a 2-3% sodium hydroxide 50%, to improve the stability of the formulated bleach.

The final filling of this foaming viscous bleach, does not present any problem of foam excess, and can be made on the same filling installation of the common bleach. Demelan® 1990 is an additive for the obtention of foaming viscous bleach, and it is stable on the commercial solutions of sodium hypochlorite.

Its incorporation to this type of products confers them detergent and foaming properties, as well as a certain viscosity.
